DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 2-4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bohan et al (5,837,433) in view of Suzuki et al (6,094,218).

Bohan et al disclose a color corrected display image that can be rapidly provided by color developing an imagewise exposed, silver halide color photographic material, scanning the developed image to form digital signals, and digitally manipulating those signals to correct either interimage interactions and/or gamma mismatches among at least two color recording units.

The color negative material may contain an amount of masking coupler and Dmin adjusting dye of up to 0.2 mmol/ m². The limited amount reduces scanning noise and the Dmin adjusting dyes reduce the optical density which improves the scanning and digitization of the exposed material. Also, when the density sources are controlled in this manner, the silver halide emulsions may then be silver bromide and not predominantly silver chloride, but in order to shorten the processing time, it is preferred that the emulsions are silver chloride (column 10, lines 22-42). The material may contain a DIR coupler to aid in increasing the sharpness of the material although they may be obviated by employing the digital scanning and color correction

Application/Control Number: 09/374,989

Art Unit: 1752

steps taught by the reference (column 11, lines 17-26 and 49-65 and column 12, lines 1-55). The material is preferably encased in a spool cartridge (column 14, lines 4-17). Photographic processing of the material may be carried out using a conventional method for processing a film in a cartridge, or alternatively, can be processed by applying viscous solutions directly to the film surface. The residual error in the responses that are photographically processed by conventional means may be corrected by transforming the photographic color negative image to density representative digital signals and applying correction values to those signals. The material is scanned and the digital records may be manipulated to produce a color corrected digital record which may then be forwarded to an output device such as a silver halide film (column 20, line 39 to column 21, line 38). The resultant material has a good sharpness. The reference provides teachings for a silver halide photographic material having a color correction function due to a masking coupler and /or a DIR coupler, and interimage effects and for an alternative method of processing such a material which includes a step of digital manipulation to produce a color corrected image. Bohan fails to teach a material having a bar code in it or on the cartridge encasing it.

Suzuki et al disclose film cartridge having a bar code. The bar code may display film information such as the type or variety of the film (i.e. color film, positive film, or negative film), the frame number, and/ or the total number of frames. It may also display any information relating to photography such as time/date information and designated print size (column 6, lines 1-36). It is the position of the examiner that one of ordinary skill in the art would recognize that within the generic "color film", "positive film" and "negative film" are many typs of materials which are different depending on the photographic additives in the film. One of

Application/Control Number: 09/374,989

Art Unit: 1752

ordinary skill in the art would have been motivated to record detailed "type or variety of film" information in the bar code of Suzuki et al so that the information is available via an image reading device.

Given the teaching of the Suzuki et al reference that a bar code providing information related to photography may be contained on the film spool cartridge and the teaching of the Bohan et al reference that the color negative film may be encased in a cartridge, it would have been obvious to one of ordinary skill in the art the to encase the photosensitive material of Bohan et al which has a color correction function in a cartridge containing a bar code such as that described by Suzuki et al. in which the film information contained by the bar code is film variety or type information useful during digital processing for that specific material.

1. Claims 2-4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bohan et al in view of Nair et al (5,753,426).

Bohan et al has been discussed above, but further teaches that the silver halide material of the invention may contain any conventionally employed layers such as filter layers, interlayers, subbing layers, and overcoats (column 7, lines 4-21).

Nair et al disclose a silver halide photographic material containing a transparent magnetic recording layer, which is capable of having coded information written and read therefrom. The information that is typically coded into the layer includes manufacturing data with regards to the various layers that are employed during the preparation of the film, information with regards to the properties of the various layers built into the substrate, and post-consumer information such as development related information, which is "helpful" to those in the developing laboratory (column 5, lines 2-23). Such information is useful in allowing a feedback loop to exposing

Application/Control Number: 09/374,989

Art Unit: 1752

devices and/or processors that could compensate for differences in sensiometry from batch to batch or to compensate for changes as a function of film aging. These corrections would reduce the variability from day to day that might otherwise occur and result in more consistent results i.e. better image quality (column 1, lines 44-53).

Given the teaching of the Nair et al reference that at transparent magnetic layer coded with information related to photography may be included in a silver halide film, and the teaching of the Bohan et al reference that the color negative film may be encased in a cartridge, it would have been obvious to one of ordinary skill in the art the to encase the photosensitive material of Bohan et al which has a color correction function choosing to include the transparent magnetic recording layer of Nair et al in which the film information contained by the bar code is processing instructions for that specific material to improve the quality of the images formed, with reasonable expectation of achieving images having good color reproduction.

Response to Arguments

1. Applicant's arguments filed 8/16/2002 have been fully considered but they are not persuasive.

Applicant has argued that the magnetic bar code of Suzuki et al, which may display film information such as the type of variety of the film (i.e. color film, positive film, or negative film, the frame number, and/or the total number of frames), time/date information, and/or designated print size would not contain processing information. It is the examiner's position that since the bar code if Suzuki et al may contain information relating to photography with respect to the type

Application/Control Number: 09/374,989 Page 5

Art Unit: 1752

of film contained in the cartridge, it would have been obvious to one of ordinary skill in the art to

encode useful information relating to all photographic layers and the additives therein.

The material of Bohan et al teaches a silver halide photographic material having a color

correction function due to a masking coupler and/ or DIR coupler, interimage effects, and for an

alternative method of processing such a material which includes a step of digital manipulation to

produce a color corrected image. It is believed that since this type of material includes a unique

processing step, a cartridge containing the film, which has a bar code, would include information

about this unique step.

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Amanda C Walke whose telephone number is 703-305-0407.

The examiner can normally be reached on M-R 5:30-4.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Janet Baxter can be reached on 703-308-2303. The fax phone numbers for the

organization where this application or proceeding is assigned are 703-872-9310 for regular

communications and 703-872-9311 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding

should be directed to the receptionist whose telephone number is 703-308-0661.
